

1.0 INTRODUCTION

Rover Pipeline LLC (Rover) is seeking authorization from the Federal Energy Regulatory Commission (FERC or Commission) pursuant to Section 7(c) of the Natural Gas Act to construct, own, and operate the proposed Rover Pipeline Project (Project). The Rover Pipeline Project is a new natural gas pipeline system that will consist of approximately 711.2 miles of Supply Laterals and Mainlines, 10 compressor stations (CS), and associated meter stations (MS), and other aboveground facilities that will be located in parts of West Virginia (WV), Pennsylvania (PA), Ohio (OH), and Michigan (MI). The Project will include approximately 509.1 miles of proposed right-of-way, extending from the vicinity of New Milton, Doddridge County, WV to the vicinity of Howell, Livingston County, MI, and will include approximately 202.1 miles of dual pipelines.

2.0 REGULATORY BACKGROUND AND REQUIREMENTS

The General Conformity Rule is codified in Title 40 of the Code of Federal Regulations (CFR) Part 51, Subpart W and Part 93, Subpart B, “Determining Conformity of General Federal Actions to State or Federal Implementation Plans” (General Conformity Rule). The General Conformity Rule applies to all federal actions, except programs and projects that require funds or approval from the United States (U.S.) Department of Transportation (USDOT), the Federal Highway Administration, the Federal Transit Administration, or the Metropolitan Planning Organization.

As defined in the Clean Air Act (CAA), Title I, section 176(c)(1), conformity means to uphold air quality goals through reduction or elimination of National Ambient Air Quality Standards (NAAQS) violations to achieve attainment with NAAQS. Accordingly, a proposed action or activity achieves conformity if the associated air pollutant emissions would not:

- cause or contribute to any new violation of any NAAQS in any area;
- increase the frequency or severity of any existing violation of any NAAQS in any area; or
- delay timely attainment of any NAAQS, required interim emission reductions, or other milestones in any area.

The process to determine conformity for a proposed action involves two steps; applicability and determination. Applicability is an assessment of whether a proposed action is subject to the General Conformity Rule. An applicability assessment must be conducted for projects that meet the criteria of a “federal action” per Title 40 CFR 93.152. FERC is the lead agency responsible for authorizing applications to construct and operate interstate natural gas transmission facilities. The Project is considered a “federal action” and the FERC is the lead agency responsible for making the conformity determination.

As required under the General Conformity Rule, an applicability evaluation is conducted for the Project to determine if the total direct and indirect emissions for criteria pollutants in a non-attainment or maintenance area exceed the rates specified in Title 40 CFR 58.853(b)(1) and (2). If emissions exceed these rates, or if the emissions are determined to be regionally significant, then a general conformity determination is required.

Title 40 CFR 93.152(c) and (d) list actions which are exempt from General Conformity. The list is extensive, and includes actions where the emissions are not readily foreseeable, the portion of an action that includes major or minor new or modified stationary sources that require a permit under the New Source Review (NSR) or the Prevention of Significant Deterioration program, and actions in response to

emergencies which commence within hours or days after the emergency. A proposed action is considered regionally significant if the total nonexempt direct and indirect emissions for a criteria pollutant under consideration (i.e., a pollutant for which the area is classified as nonattainment or maintenance) or its precursor pollutants represent 10 percent or more of a nonattainment or maintenance area emissions inventory for that pollutant. As such, estimated emissions for the Project subject to review under the General Conformity thresholds are those associated with construction emissions or operational emissions not subject to major or minor NSR permitting.

If the General Conformity Rule is applicable for a proposed action, then a General Conformity Determination may be required. The determination process is an assessment of whether the proposed action conforms to the applicable state implementation plan (SIP). Positive conformity can be shown through State emission budgets, emission offsets, air quality models, or a combination of these.

3.0 APPLICABILITY

The conformity applicability thresholds apply to each air quality control region (AQCR) or designated portion thereof within the non-attainment or maintenance area. Pollutants of particular concern in these areas are ozone, particulate matter with an aerodynamic diameter no greater than 2.5 microns (PM_{2.5}), particulate matter with an aerodynamic diameter no greater than 10 microns (PM₁₀), sulfur dioxide (SO₂), and their precursors [nitrogen oxides (NO_x) and volatile organic compounds (VOC)]¹. General Conformity assessments must be completed when the total direct and indirect emissions of a project would equal or exceed specified pollutant thresholds on a calendar year basis for each nonattainment or maintenance area.

With respect to the Project, the relevant general conformity pollutant thresholds are listed in Table 3-1. The thresholds in Table 3-1 are based on the current air quality designations (e.g., serious nonattainment, moderate nonattainment, maintenance) for each county within each AQCR in tpy (tons per year).

Air Quality Control Region	Pollutant/ Status	Applicability Threshold	County, State	Project Components
Steubenville-Weirton-Wheeling Interstate AQCR	O ₃ / Maintenance	100 tpy of NO _x or VOC	Belmont Co, OH	Clarington Lateral Majorsville Lateral
			Marshall Co, WV	Majorsville Lateral Majorsville CS Majorsville Receipt MS
			Jefferson Co, OH	Burgettstown Lateral
	PM _{2.5} / Maintenance	100 tpy of PM _{2.5} , SO ₂ , or NO _x	Belmont Co, OH	Clarington Lateral Majorsville Lateral
			Marshall Co, WV	Majorsville Lateral Majorsville CS Majorsville Receipt MS
			Jefferson Co, OH	Burgettstown Lateral

¹ Depending on the context, SO₂ is evaluated either directly as a criteria pollutant or a PM_{2.5} precursor.

TABLE 3-1 Nonattainment and Maintenance Areas Crossed by the Project				
Air Quality Control Region	Pollutant/ Status	Applicability Threshold	County, State	Project Components
Steubenville-Weirton-Wheeling Interstate AQCR (cont'd)	PM ₁₀ / Maintenance	100 tpy of PM ₁₀	Jefferson Co, OH	Burgettstown Lateral
	SO ₂ / Nonattainment	100 tpy of SO ₂	Jefferson Co, OH	Burgettstown Lateral
			Marshall Co, WV	Majorsville Lateral Majorsville CS Majorsville Receipt MS
Greater Metropolitan Cleveland Intrastate AQCR	O ₃ / Maintenance	100 tpy of NO _x or VOC	Stark Co, OH	Mainlines A & B
	PM _{2.5} / Maintenance	100 tpy of PM _{2.5} , SO ₂ , or NO _x

	PM _{2.5} / Maintenance	100 tpy of PM _{2.5} , SO ₂ , or NO _x	Washtenaw Co, MI	Market Segment Consumer Energy Deliver MS
			Livingston Co, MI	Market Segment Vector Deliver MS

4.0 ASSESSMENT OF THE PROJECT EMISSIONS

In February 2015, Rover provided estimated construction emissions for the Project based on preliminary, conservative assumptions on equipment and construction personnel for each project component (e.g., lateral, mainline, compressor station). The resulting emissions were ratioed to provide an estimate of each pollutant by county. Assumptions used in developing these estimates included the following:

- Emission estimates were based on “general pipeline construction project” assumptions (a generic template with worst-case default assumptions on work force, quantities of equipment in different categories and their utilization, and default equipment fleet average emission factors. These assumptions were made because Rover had not identified or hired its construction contractors, nor had Rover determined its construction plan at the time of the filing. Rover has since hired its contractors, all of which are all top-tier contractors, utilizing the most modern and efficient equipment fleet as well as the most highly trained professionals in the pipeline construction business, which greatly reduces the potential air emissions resulting from the Project.

- The equipment used for construction of dual pipelines (i.e., Mainlines A and B) were double-counted, because it was assumed that an entire fleet of equipment would be used for each mainline. However, the revised construction plan will entail the same equipment being used first to install Mainline A, and then Mainline B, therefore reducing the total number of pieces of equipment and the duration of use for each piece.
- The construction emissions associated with the construction of a pipeline would be proportional to the length of pipeline in that county, unless there are specific reasons to do otherwise. Therefore, the revised emissions are reflective of the estimated duration each piece of equipment will actually be working to accomplish the construction based upon the site-specific conditions, actual type of equipment, and the rate of progress. For example, in agricultural areas, the rate of progress is estimated to be 6,352 feet installed per day, as compared to rough or steep topography which is estimated to be 3,750 feet per day. Therefore, the equipment operating in rough topographic conditions will be utilized for longer durations as compared to the agricultural areas, where construction will progress at a more rapid pace. These emissions are then summed within the county affected or region to determine the effect on General Conformity.
- Since the first emissions estimates were provided, Rover has retained construction contractors for the Project. These contractors have provided Project-specific estimates of equipment counts and utilization, construction personnel, materials, and construction schedules. In general, based upon the selected contractors' projections, the majority of the equipment will be U.S. Environmental Protection Agency (USEPA) Tier 3, interim Tier 4, or final Tier 4 compliant equipment, and as a standard practice, all equipment will be operated and maintained in accordance with manufacturers' requirements and industry best practices.

Fugitive dust would result from land clearing, grading, excavation, and vehicle traffic on unpaved roads. The amount of dust generated would be a function of construction activity, soil type, soil moisture content, wind speed, precipitation, vehicle traffic, vehicle types, and roadway characteristics. Emissions would be greater during dry periods and in areas of fine-textured soils subject to surface activity. Since the Project is located in one of the wettest regions of the U.S. and the Project will be constructed in the seasons when precipitation is anticipated, dust emissions are not anticipated to be a major contributor to the regional or site-specific air quality degradation. Additionally, when looking at the soil types across the Project region (See Figure 1. Soil Texture Class), the majority of the soils crossed are loams, with most having some level of sandy loam texture. These soils would generate less dust compared to silts and clays. Therefore, Rover does not anticipate an issue with dust emissions. If an abnormally dry period occurs where excess dust would be generated during construction, Rover would implement the following measures to control fugitive dust during Project construction, especially in sensitive areas such as road crossings, residences, and nonattainment areas:

- minimizing the generation of fugitive dust by:
 - watering or applying other dust suppressants to the construction workspace and access roads,
 - providing measures to limit track-out onto the roads (e.g. gravel entrances road cleanup),
 - maintaining a speed limit of 5 miles per hour (mph) on unsurfaced roads, and
- providing authority to construction inspectors to direct dust mitigation measures and stop work until dust control measures are installed; and
- establishing monitoring for PM₁₀ and recordkeeping of dust control as implemented.

Estimated emissions for the Project subject to review for General Conformity, along with a comparison to the applicable General Conformity threshold are presented in Table 4-1.

TABLE 4-1				
Comparison of Emissions Subject to General Conformity Review to Applicability Thresholds				
Nonattainment or Maintenance Areas	County, State	Pollutant/	Applicability Threshold (tpy)	Nonexempt Emissions (tpy)
<i>Steubenville-Weirton-Wheeling Interstate AQCR</i>				
Wheeling, WV-OH	Belmont Co, OH Marshall Co, WV	NO _x	100	46.51
		VOC	100	42.02
		PM _{2.5}	100	13.84
		SO ₂	100	1.95
Steubenville-Weirton, OH-WV	Jefferson Co, OH	NO _x	100	30.34
		VOC	100	10.54
		PM _{2.5}	100	5.11
		PM ₁₀	100	0.27
		SO ₂	100	46.51
<i>Greater Metropolitan Cleveland Intrastate AQCR</i>				
Canton-Massillon, OH	Stark Co, OH	NO _x	100	13.52
		VOC	100	13.28
		PM _{2.5}	100	3.66
		SO ₂	100	0.11
<i>Metropolitan Toledo Interstate Air Quality Control Region</i>				
Toledo, OH	Wood Co, OH	NO _x	100	3.60
		VOC	100	3.84
<i>Southwest Pennsylvania Intrastate AQCR</i>				
Pittsburgh-Beaver Valley, PA	Washington Co, PA	NO _x	100	24.47
		VOC	50	8.63
		PM _{2.5}	100	4.62
		SO ₂	100	1.57
<i>South Central Michigan Intrastate AQCR</i>				
Detroit-Ann Arbor, MI	Lenawee Co, MI Washtenaw Co, MI Livingston Co, MI	NO _x	100	16.53
		VOC	100	14.93
		PM _{2.5}	100	14.59
		SO ₂	100	0.55

As shown in Table 4-1, during all years of construction, emission estimates would not exceed General Conformity applicability thresholds. Based upon this evaluation, a General Conformity assessment is not required. If the schedule for construction should change, or modifications to the Project would result in emissions that would exceed the general conformity applicability thresholds in one calendar year, Rover will provide updated emissions estimates to determine if a General Conformity Determination is required at that time.

Backup calculations are provided in Appendix A.

Appendix A

Detailed Emissions Calculations

¹ All construction activity and associated emissions are projected to take place in a single year.

² Parts of Marshall County WV are designated nonattainment for SO2, however, the Majorsville Compressor Station will be located in the attainment portion of the county.

³ Washington County, Pennsylvania is non-attainment for 8-hr Ozone and 24-hr PM2.5.

⁴ Meter station will be located within the associated compressor station

⁵ The Clarington Compressor Station will contain twon receipt meters and two bidirectional meters

⁶ The Cadiz Compressor Station will contain two receipt meters

Sample Calculations: Estimates by county were made by pro-rating the total construction emission by pipeline mileage and number of sites within a given county

Monroe County PM10 emissions

PM10= 44mi Lateral Pipeline PM10 + Clarington CS PM10 + Hall Receipt PM10 + Gulfport Receipt PM10 + Berne Receipt PM10

PM10= (44mi/195 total lateral miles)*765.8 tons (Lateral Pipeline PM10 Emission Total) + 11.2 tons (Clarington CS PM10 Emission Total) + (3/8 stand-alone stations)*14.3 tons (Stand-alone Metering Station PM10 Emission Total)

PM10= 97.6 tons

Belmont County NOx emissions

NOx= 36mi Lateral Pipeline Nox

NOx= (36mi/195 total lateral miles)*531.8 tons (Lateral Pipeline NOx Emission total)

NOx= 34.3 tons

¹ Excavation and backfilling for pipeline assumes will be 10ft x 30ft x approximate length (mi). Excavation and backfilling for compressor stations conservatively assumes 10% of project acreage is impacted, at 10 foot depth. Soil density is assumed to be 100 lb/cf.

² Excavation and backfilling factors from AP-42, Table 11.9-4 (dated 7/98), assuming 100% of TSP is PM10.

³ Windblown dust factor from "Improvement of Specific Emission Factors" prepared for South Coast AQMD by Midwest Research Institute, March 1996, assuming 100% of TSP is PM10.

⁴ Control efficiency based on "Control of Open Fugitive Dust Sources", USEPA, 9/88. Project measures to minimize dust will primarily include the utilization of water trucks to dampen the ROW under dry-dusty conditions.

⁵ PM10 emissions are conservatively assumed to be 100% of TSP.

⁶ PM2.5 emissions were calculated following the SCAQMD Particulate Matter (PM) 2.5 Significance Thresholds and Calculation Methodology, October 2006. For construction and demolition fugitive dust sources, 10% of the PM10 would be PM2.5.

* Pipe yards/ware yards are assumed to have negligible particulate emissions because of no construction activities.

Example Calculations:

Mainline A & B Excavation (tons) = 10 ft * 30 ft * 209.5 mi/yr * 5280 ft/mi * 100 lb/ft³ / 2000 lb/ton = 16,592,400 tons soil

Mainline A & B Excavation PM10 Emissions (tons) = 16,592,400 tons soil * 0.058 lb/ton / 2000 lb/ton * 0.59 = 283.9 tons PM10; PM2.5 emissions are 20.8% of PM10 emissions.

Mainline A & B Backfilling (tons) = excavation (tons) = 16,592,400 tons soil

Mainline A & B Backfilling PM10 Emissions (tons) = 16,592,400 tons soil * 0.012 lb/ton / 2000 lb/ton * 0.59 = 58.7 tons PM10; PM2.5 emissions are 20.8% of PM10 emissions.

Mainline A & B Windblown Dust (ft²/yr) = 4018.59 acres * 43,560 ft²/acre = 175,049,780 ft²

Mainline A & B Windblown Dust PM10 Emissions (tons) = 175,049,780 ft² * 2.52E-05 lb/ft² * (100-66)/100 / 2000 lb/ton * 0.59 = 0.442 tons PM10; PM2.5 emissions are 20.8% of PM10 emissions.

**Table 9A-26
Rover Emissions from Construction Equipment and Vehicle Travel on Unpaved Roads**

Unpaved Roads emission factor from AP-42, Section 13.2.2: Unpaved Roads (11/06)

$$E = [k(s/12)^b(W/3)^d]^{1/4}[(365-P)/365]$$

where:

s = 8.5	surface material silt content (%) [Table 13.2.2-1, Construction sites mean silt content %]
W = 10	tons [Average vehicle weight]
k = 1.5	lb/VMT [Table 13.2.2-2, for PM ₁₀]
k = 0.15	lb/VMT [Table 13.2.2-2, for PM _{2.5}]
a = 0.9	constant [Table 13.2.2-2, for PM ₁₀ and PM _{2.5}]
b = 0.45	constant [Table 13.2.2-2, for PM ₁₀ and PM _{2.5}]
P = 145	days [Average number of days with > 0.01 inches of precipitation for north OH, Figure 13.2.2-1]
E (PM ₁₀) = 1.13	lb/VMT
E (PM _{2.5}) = 0.11	lb/VMT

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).

² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).

⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors

⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton

**Table 9A-28
Rover Construction Activity Green House Gas Emissions - Precision**

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).

² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).

⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors for Nonroad Engine Modeling: Spark Ignition"

⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton

**Table 9A-28
Rover Construction Activity Green House Gas Emissions - USP**

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).

² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).

⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors for Nonroad Engine Modeling: Spark Ignition"

⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).

² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).

⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors for Nonroad Engine Modeling: Spark Ignition"

⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton

**Table 9A-28
Rover Construction Activity Green House Gas Emissions - Michels**

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).

² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).

⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors for Nonroad Engine Modeling: Spark Ignition"

⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton

Burgettstown Compressor Station Emissions 5.1 0.7 24.2 1.4 0.7 0.6

¹ List includes representative equipment for all activities (clearing & grading, ditching, bending, etc.) and crew types (welding crew, coating crew, lowering crew, etc.).
² Based on values presented in EPA guidance document "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (EPA420-P-04-005 dated April 2004).
³ Information on the number of vehicles and vehicle operation is based on a pipeline construction spread of approximately 200 miles, and average compressor station size.
⁴ Factors developed using methodology presented in EPA guidance documents "Exhaust and Crankcase Emission Factors for Nonroad Engine Emissions Modeling--Compression-Ignition" and "Exhaust Emission Factors for Nonroad Engine Modeling: Spark Ignition"
⁵ Project Emissions Rate = Engine Rating (hp) x Load Factor x Total Operation (hr/project) x Exhaust Emission Factor (g/hp-hr) / 453.6 grams/lb / 2000 lb/ton
⁶ Emissions are captured as on-road emissions
⁷ Includes Hydro-Axes, ASV with flail, and Morooka 1500
⁸ Includes D7 and D8 tow tractors
⁹ Includes motorgrader #14

**Table 9A-28
